The future of the profiles

Aluminium

The future of the profiles!

Our company's main activity is production, machining and assembly of semi-finished aluminium products in small and large quantity, we also produce unique products on request.

We also manufacture aluminium parts and structures from purchasing material, surface treatment, cutting to assembling and packing. Moreover, we undertake metal work locally.

AM Production provides you with solutions to many aspects of life!

Cutting

We cut aluminium profiles to size by the automatic cutting machine or double head CNC saw. The product length can be in 10 to 9.000 millimeters and its cutting angle can be between 23 and 90 degrees.

Machining

Milling, drilling holes and threads on profiles, rod material, thin and thick plates with 3 and 4 axis machining centres.

In our milling centre, parts of different variety and complexity are manufactured by 12 equipment. These parts could be small, few millimeters of fixing elements or sometimes over 10 meter long holding elements.

Attrition

Removing burrs, rounding edges and cleaning surface of metal parts.

Assembly

The machined pieces are assembled with small component and these items are packed on demand.

Welding

Our machines are able to produce welded parts and structures made of our manufactured pieces and added components.

Construction work

Our experienced metal workers provide high-level implementation with their modern equipment.

Aluminium profiles and machine building elements are compatible with BOSCH and ITEM!

Our company deals with systems which are compatible with Bosch Rexroth and ITEM profiles beyond machining.

Advantages of aluminium profiles against to other fix frame structures:

- their structure is light, aesthetic;
- they can be assembled without welding;
- they don't need to be painted, surface treated;
- they can be disassembled easily at anytime;
- their elements can always be recycled according to the current needs
- anything can be built of them starting from the most simple workdesks through the different sized containers to the most complicated production lines.

The profiles for machine building are groove designed including many different accessories (T-slot nuts, hammer screws, corner elements and other fasteners belonging to the system). They can be assembled quickly, easily and even without machining because there are more solutions to joining them.

Beyond machining, welding and assembling, our company has been dealing distribution of Bosch and ITEM compatible profiles and their accessories in the retail market. In our storehouse, there are different type and cross-section of profiles and accessories. These 6 meters long profiles are sold without machining but we can also machine on demand.

Beside the standard products, we also undertake the manufacturing of unique products. We can provide the independent usage of construction profiles in different industries.

There are no limits!

Overall, the usage of aluminium profiles is limitless because there are lots of unexploited opportunities of the industry of the present and the future.

With AM Production aluminium solutions come true the way you want.

Our flexible and reliable team work is precise and coordinated, guarantees customer satisfaction at all times.

Our quality policy

Efficient production with 100% customer satisfaction!

The future of the profiles!
